## Abstracts

According to our (Global Info Research) latest study, the global Electric Traction Shearer market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

The electric traction shearer is a type of coal mining machinery that uses electric energy to drive and crush and load coal on the long wall mining face through rail transportation and traction. Electric traction shearers are available in a variety of models and specifications, suitable for coal seams of different thicknesses and hardness. The advantages of electric traction shearers are good traction characteristics, good dynamic performance, sensitive response, reliable operation, high efficiency, long service life, complete detection and display systems, and can operate safely in coal mines with explosive mixed gases and gas and coal dust. . The main structural components of the electric traction shearer include left and right rocker arms, left and right rollers, traction transmission box, external traction, pump station, high-voltage control box, traction control box, height-adjusting cylinder, main frame, auxiliary components, etc. The working principle of the electric traction shearer is to rely on the sliding shoe to ride on the scraper conveyor, and rely on the sprocket of the traction transmission part to mesh with the pin row to provide power for the shearer to move. This is achieved by the rocker arm and drum of the cutting part. Dropping and loading coal. The control system of the electric traction shearer uses industrial programmable controllers, industrial control computers, AC variable frequency speed regulators, LCD screens, remote controls, etc., which can realize automatic speed adjustment, automatic height adjustment, automatic cutting, etc. of the shearer. Remote monitoring, fault diagnosis and other functions.
