Abstracts

The global Electric Wide Body Mining Truck market size is expected to reach \$ 23888 million by 2032, rising at a market growth of 22.1% CAGR during the forecast period (2026-2032).

Electric Wide Body Mining Trucks, also known as electric mining wide-body dump truck, electric mining haul trucks or electric mining dumpers, generally refer to mining haulage vehicles with a body width of more than 2.5 meters. These vehicles use pure electric drive, battery-swapping electric drive, or new-energy electric drive systems powered primarily by traction batteries as their main power source, and are specifically designed for material transportation under off-highway mining conditions. Electric Wide Body Mining Trucks are mainly used in open-pit mining scenarios to transport large quantities of bulk materials such as coal, ore, overburden waste rock, and other mined materials.

In 2025, global Electric Wide Body Mining Trucks production reached approximately 6,684 Units, with an average global market price of around US\$ 794 k per unit.

The upstream supply chain of Electric Wide Body Mining Trucks mainly includes high-strength steel, battery cells, electric motors, mining tires, etc. Major material suppliers include Baowu Steel, HBIS Group, ArcelorMittal, Nippon Steel, etc.

Electric Wide Body Mining Trucks are mainly used in Open Pit Coal Mine, Metal Ore, and Others. Typical customer groups include China Energy Investment Corporation, China National Coal Group, Shaanxi Coal and Chemical Industry Group, etc.

The gross margin of Electric Wide Body Mining Trucks is generally at 20%-35%.

By product type, Electric Wide Body Mining Trucks can be divided into Less than 60t, 60t - 100t and Above 100t. Less than 60t models are mainly positioned for small and medium-sized mines, quarrying sites and enclosed earthmoving projects where payload demand is moderate and transport distances are relatively short. These models usually have lower battery capacity, lower motor power and lower acquisition cost, making them suitable for customers that require flexible deployment and lower initial investment. The 60t - 100t segment is the mainstream commercial payload range for Electric Wide Body Mining Trucks, as it offers a balanced combination of payload capacity, battery cost, vehicle price, energy consumption, charging feasibility and battery-swapping compatibility. Above 100t models are designed for larger open-pit mines and high-intensity mining haulage operations, where customers require higher payload efficiency, stronger climbing capability, larger battery capacity, more robust braking systems and higher vehicle availability. This segment has higher technical barriers and higher unit value, and it is increasingly associated with large-scale mine decarbonization and fleet electrification projects.

By application, Electric Wide Body Mining Trucks are mainly used in Open Pit Coal Mine, Metal Ore and Others. Open Pit Coal Mine is one of the most suitable application scenarios because haulage routes are relatively fixed, vehicle utilization is high, loading and unloading cycles are frequent, and centralized charging or battery swapping can be organized more efficiently. Metal Ore applications include iron ore, copper ore, gold ore, bauxite and other metal mining operations, where customers place stronger emphasis on payload efficiency, slope performance, vehicle reliability, braking safety, thermal management and compatibility with mine dispatching systems.

The market growth of Electric Wide Body Mining Trucks is supported by multiple driving factors. Green mine policies and carbon-reduction targets are encouraging mining companies to replace diesel haulage equipment with electric alternatives. Rising diesel costs and high fuel consumption in mining haulage make electric trucks attractive from a total cost of ownership perspective. The rapid development of traction batteries, high-power electric motors, electric control systems and battery-swapping infrastructure is improving vehicle reliability and operating efficiency. Fixed mine routes, closed operating environments and frequent downhill braking create favorable conditions for energy recovery and centralized energy management. In addition, mining companies are increasingly combining electrification with autonomous driving, fleet scheduling, remote monitoring and digital mine platforms, which strengthens the long-term value of Electric Wide Body Mining Trucks beyond basic vehicle replacement.

The market also faces several restraints. The initial purchase cost of Electric Wide Body

Mining Trucks is usually higher than that of diesel vehicles, especially for 60t - 100t and Above 100t models with large battery packs. Charging stations, battery-swapping stations, grid upgrades and mine-site power distribution require additional capital expenditure and project coordination. Battery safety, battery cycle life, performance degradation under high-load operation and thermal management remain important concerns for mining customers. In cold regions, high-altitude mines, long uphill haulage routes and mines with insufficient grid capacity, the economic advantage of electric trucks may be less obvious. The market is also affected by uncertainty in residual value, battery replacement cost, after-sales service capability, spare parts availability and the operational learning curve of mine operators shifting from diesel fleets to electric fleets.
