The global Electrical Power Transmission Line Engineering market size is expected to reach \$ 1443 million by 2032, rising at a market growth of 5.8% CAGR during the forecast period (2026-2032).

Electrical Power Transmission Line Engineering is a core sub-discipline of power system engineering, which covers the full life-cycle technical practice and scientific management of planning, design, material selection, construction, installation, operation & maintenance (O&M), fault diagnosis, renovation and upgrading of electrical transmission lines. As the backbone of the bulk power grid, its core objective is to realize the efficient, safe, reliable and economical long-distance transmission of large-scale electric energy from power generation sources (thermal, hydro, wind, photovoltaic, nuclear power plants, etc.) or step-up substations to regional load centers, step-down substations and distribution networks, while minimizing power loss, controlling electromagnetic environmental impact, and maintaining the stability and security of the interconnected power system. It is distinctly differentiated from electric power distribution engineering, which handles the local power delivery from substations to end customers.
