The global Electrically Driven Ion Removal Module market size is expected to reach \$ 159 million by 2032, rising at a market growth of 6.2% CAGR during the forecast period (2026-2032).

An electrically driven ion removal module is a device that removes dissolved ions from continuously flowing water using ion exchange resins, selective ion exchange membranes, and a direct current electric field. This module achieves continuous ion removal and high-purity water production without the need for chemical regenerators. It is widely used in ultrapure water systems in industries such as power, electronics, pharmaceuticals, and chemicals, providing stable water quality and reducing operating costs. It can also be used in conjunction with reverse osmosis systems to achieve multi-stage water treatment and water quality optimization.

The industrial chain of electrically driven ion removal modules mainly includes three segments: upstream raw materials and core components, midstream module design and manufacturing, and downstream system integration and application services. Upstream involves key components such as high-performance ion exchange resins, selective ion exchange membranes, electrode materials, pumps, and controllers. Midstream involves equipment manufacturers performing modular design, assembly, DC electric field integration, and intelligent control system development to form electrically driven ion removal modules capable of continuously removing ions from water. Downstream applications cover ultrapure water systems, power boiler water treatment, semiconductor manufacturing, pharmaceuticals, and chemicals, extending to system integration, maintenance services, and water quality monitoring and optimization solutions, providing users with complete water treatment solutions.

In 2025, the average price of electrically driven ion removal modules is US\$5,000 per unit, with sales volume of 20,200 units, total production capacity of 28,900 units, and a gross profit margin of approximately 43%.
