According to our (Global Info Research) latest study, the global Electricity Market Operation System market size was valued at US\$ 934 million in 2025 and is forecast to a readjusted size of US\$ 1592 million by 2032 with a CAGR of 7.9% during review period.

The electricity market operation system is the core technological platform and rule set that supports the market-oriented trading of electricity commodities. It achieves automated management of the entire process?from trading and scheduling to settlement of electric energy?through informatization methods. The system integrates key modules such as medium- and long-term trading, day-ahead and real-time spot markets, and ancillary service markets. It uses complex clearing algorithms to generate time-of-use electricity prices and generation-consumption plans, ensuring that power generation companies, electric power sales companies, electricity users, and grid operators can compete and settle efficiently and safely under open and transparent market rules. It serves as the 'central brain' and infrastructure for the stable operation of the modern electricity market.

The prospects for the electricity market operation system are extremely broad, with its core driving forces coming from global energy transition and electricity market reforms. As the proportion of renewable energy significantly increases and distributed energy and storage are widely integrated, the system needs to evolve toward higher flexibility, real-time capability, and intelligence to cope with significant uncertainties on both the supply and demand sides. In the future, the system will deeply integrate artificial intelligence, blockchain, and big data technologies to achieve more accurate load forecasting, market simulation, and risk prevention, supporting emerging business

models such as virtual power plants and green electricity trading. Its development will drive the electricity market to expand from a regional to a national and even cross-border interconnected market, becoming a key technological pillar for building a new type of power system and achieving the 'dual carbon' goals.
