According to our (Global Info Research) latest study, the global Electro-hydraulic Servo CNC Bending Machine market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

The electro-hydraulic servo CNC bending machine adopts the hydraulic automatic deflection compensation mechanism of the workbench, which is composed of a group of oil cylinders installed in the lower workbench. The position and size of each compensation cylinder are based on the deflection analyzed by the finite element analysis of the slider and workbench. The compensation curve is designed. The hydraulic compensation is to realize the bulge compensation of the neutral version through the relative displacement between the front, middle and rear three vertical plates. The principle is to realize the bulge through the elastic deformation of the steel plate itself, so the compensation amount can be The adjustment is realized within the elastic range of the workbench. The fuselage is designed through finite element optimization to ensure that the machine tool has high strength and high rigidity when it is used; compared with traditional CNC bending machines, it increases the filling flow, oil pump displacement, etc., and the Y-axis movement frequency is higher than the mainstream bending machine in the market. machine increased by about 25%.
