According to our (Global Info Research) latest study, the global ElectroChemiluminescence (ECL) Analyzer market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

From a technical point of view, ElectroChemiluminescence (ECL) is the most competitive and technologically advanced chemiluminescent technology. Its technical principle is based on photoelectron excitation, sufficient energy conversion, wide linear range, and is not easily affected by enzymes, etc. Some active substances are affected, because its chemiluminescent marker - ruthenium terpyridine has a small molecular weight, simple structure, very stable labeling, and has a particularly small impact on the function of the antibody. The luminescent substrate tripropylamine TPrA polar substance, under the electric field, continuously enables electrons to obtain electron energy. This process goes on repeatedly on the electrode surface, generating many photons, and finally forms a photoexcitation effect, which enhances the light signal and emits The light distance is long, which better guarantees the stability and efficiency of ElectroChemiluminescence (ECL).
