Abstracts

The global Electrodeposited Copper Acid Mist Inhibitor market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

When the smelter is conducting electrolytic copper operation, a large amount of sulfuric acid mist will overflow from the bath, which not only pollutes the environment, but also endangers the health of workers. Therefore, the smelters have to collect and treat the acid mist generated by electrolysis. This method not only requires huge investment, high operating cost, inconvenient operation, but also unsatisfactory treatment effect. The acid mist inhibitor produced according to the formula of the latest technology and high-quality imported raw materials can effectively inhibit the generation of acid mist, and at the same time improve the internal and appearance quality of the electrodeposited copper plate, and can make the product have a certain brightness, which is environmentally friendly. And the health of workers has played a very good role in protection. Therefore, the application of electrodeposited copper acid mist inhibitor is more and more extensive.

Electrodeposited copper acid mist inhibitor is a fairly stable fluorocarbon, which is directly applied to the electrolytic solution to inhibit the formation of acid mist by reducing the surface tension of the electrolytic solution, improving the air quality of the electrolytic workshop and providing occupational health benefits. protection and increase the service life of the equipment. It is mainly used in the electrowinning section of hydrometallurgy copper, and can be used with floating plastic pellets. A large amount of foam will not be generated on the surface of the electrodeposition liquid, the loss of the acid mist inhibitor is avoided, and there is no adverse effect on the solvent extraction and electrodeposition process.
