The electrodeposited copper foil cathode drum is a crucial component in the manufacturing of copper foils for use in electronic devices. It is a rotating drum, typically made of titanium, that serves as the cathode in an electroplating process. During this process, copper ions from an electrolyte solution are deposited onto the drum's surface when an electric current is applied. This results in the formation of a thin, uniform layer of copper foil. The foil is then peeled off and processed for use in applications like printed circuit boards (PCBs). The use of titanium enhances the drum's durability and resistance to corrosion, ensuring consistent quality and performance in the production of high-quality copper foils.
