The global Electrodeposition Instrument market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Electrodeposition Instrument, also known as Electroplating Instrument, is a device used for electrodeposition, which is the process of depositing a thin layer of metal or other material onto a surface by means of an electric current. Electrodeposition is commonly used in the manufacturing of electronic components, jewelry, and other products that require a thin, uniform coating of metal. The electrodeposition instrument typically consists of a power supply, an electrolyte solution, and two electrodes (an anode and a cathode) that are immersed in the solution. When an electric current is applied to the electrodes, metal ions in the solution are attracted to the cathode and deposited onto the surface of the object being plated.
