An Electrohydraulic Proportional Control System (EHPCS) is a type of control system that integrates electronic controls with hydraulic actuators to achieve precise and responsive control of fluid power in machinery and industrial applications. It uses proportional valves, which are controlled by electrical signals that modulate the flow and pressure of hydraulic fluid, allowing for variable and finely tuned movement of actuators, such as cylinders or motors. The system's electronic controllers use sensors to monitor various parameters like position, speed, and force, adjusting the output in real-time to achieve the desired performance. EHPCS offers high levels of accuracy, repeatability, and smooth operation, making it ideal for applications requiring precise control, such as in industrial automation, mobile equipment, and aerospace. Its ability to provide variable output rather than simple on/off control distinguishes it from traditional hydraulic systems, making it more efficient and adaptable to complex tasks.
