## Abstracts

According to our (Global Info Research) latest study, the global Electrolysis Ozone Systems market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

An Electrolysis Ozone System, also known as an electrolytic ozone generator, is a type of ozone generator that produces ozone through an electrochemical reaction. Unlike corona discharge or cold plasma ozone generators, electrolysis ozone generators use an electrolyte solution, typically containing water and a small amount of salt or other electrolyte, to generate ozone.

The Electrolysis Ozone System consists of two electrodes, commonly made of metal or metal oxide, immersed in the electrolyte solution. When an electric current is passed through the electrodes, electrolysis occurs, resulting in the generation of ozone at the anode. Electrolysis ozone generators are known for their simplicity and efficiency in producing ozone. They do not require an external air or oxygen source since ozone is produced directly from the water. They also eliminate the need for additional air preparation or oxygen concentrators. These ozone generators are commonly used in applications such as water treatment, swimming pool sanitation, and air purification. They are suitable for situations where high ozone concentrations are desired or where a continuous and reliable supply of ozone is required.
