## Abstracts

According to our (Global Info Research) latest study, the global Electrolytic Zinc Anode Plate market size was valued at US\$ 12610 million in 2024 and is forecast to a readjusted size of USD 15610 million by 2031 with a CAGR of 3.1% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Electro-zinc anode plate is a core anode material used in the electro-zinc process. It is often used in the zinc electrolysis process to deposit zinc onto the cathode through electrochemical reaction to extract pure zinc. Electro-zinc anode plates usually use titanium as the substrate, and the surface is coated with an active catalytic coating to improve electrochemical efficiency and corrosion resistance. Its structural design usually includes a titanium substrate and a special active coating, which has good conductivity, durability and stability. In the electro-zinc process, the main function of the anode plate is to serve as a conductive source of current and to stably release zinc ions in the electrolyte. Since its working environment contains corrosive media such as sulfuric acid, the corrosion resistance of the anode plate is required to be high. The life and efficiency of the anode plate directly affect the production cost and quality of electro-zinc, so modern electro-zinc anode plates mostly use more durable titanium substrates and special electrochemical active coatings to extend their service life.
