The global Electromagnetic Active Buzzer market size is expected to reach \$ 392 million by 2032, rising at a market growth of 5.4% CAGR during the forecast period (2026-2032).

In 2025, global sales volume of Electromagnetic Active Buzzer was approximately 1.2 billion units, with a global average selling price of about USD 0.22 per unit. The gross margin of major manufacturers was generally around 20%-35%.

An Electromagnetic Active Buzzer is an electromagnetic acoustic component with a built-in oscillation and driving circuit, which can generate sound simply by applying the rated DC voltage. Its core structure typically consists of a coil, magnet, diaphragm, housing, and built-in drive circuit. During operation, the coil generates an alternating magnetic field, which drives the diaphragm to vibrate and produce an audible signal. The product features a simple structure, fast response, relatively high sound pressure, easy driving, low cost, and good reliability. Compared with piezoelectric buzzers, Electromagnetic Active Buzzers usually produce a deeper sound and offer advantages in stable acoustic output, cost efficiency, and ease of integration.

The upstream materials and components of Electromagnetic Active Buzzer mainly include enameled wire, magnets, diaphragms, plastic housings, metal terminals, PCBs, resistors, capacitors, and oscillation drive circuit components. The midstream segment consists of buzzer manufacturers responsible for magnetic circuit design, coil winding, diaphragm assembly, soldering and packaging, sound pressure testing, and reliability inspection. Downstream applications mainly include home appliances, consumer electronics, industrial control, automotive electronics, security and alarm systems, medical devices, smart meters, and communication and office equipment, where the

product is used for key-tone feedback, status indication, fault alarms, and safety warnings.
