According to our (Global Info Research) latest study, the global Electromagnetic Induction Dental Casting Machine market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Electromagnetic induction dental casting machine is a device used for dental restoration work, which heats metal materials to a molten state through the principle of electromagnetic induction, and then injects molten metal into molds for crowns or other dental restorations for casting . The use of electromagnetic induction dental casting machines can improve the accuracy and efficiency of dental restoration work, and can also reduce the labor intensity and operational difficulty of staff. Because the equipment uses the principle of electromagnetic induction heating, it can quickly reach the melting temperature of the metal material, and can avoid the metal oxidation and pollution problems that may occur in the traditional flame heating method, so as to obtain more pure casting materials.
