## Abstracts

The global Electromagnetic Induction Dental Casting Machine market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

Electromagnetic induction dental casting machine is a device used for dental restoration work, which heats metal materials to a molten state through the principle of electromagnetic induction, and then injects molten metal into molds for crowns or other dental restorations for casting . The use of electromagnetic induction dental casting machines can improve the accuracy and efficiency of dental restoration work, and can also reduce the labor intensity and operational difficulty of staff. Because the equipment uses the principle of electromagnetic induction heating, it can quickly reach the melting temperature of the metal material, and can avoid the metal oxidation and pollution problems that may occur in the traditional flame heating method, so as to obtain more pure casting materials.

This report studies the global Electromagnetic Induction Dental Casting Machine production, demand, key manufacturers, and key regions.
