According to our (Global Info Research) latest study, the global Electromagnetic Interference (EMI) Shielding Sealing Rubber Materials market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Electromagnetic Interference (EMI) Shielding Sealing Rubber Materials (usually EMI gaskets, Rubber strip), are made of electrically conductive elastomers such as silicone or fluorosilicone provide environment sealing, thermal insulation, and shielding against electromagnetic interference (EMI). They support a variety of fabrication methods, are available in materials that meet tough standards, and can be supplied with conductive adhesive backings for ease-of-installation. There are many types of EMI shielding materials, but electrically conductive silicones provide gasket designers with performance and versatility. Specifically, EMI gaskets seal the gap between two mating surfaces. Like other types of environmental gaskets, they seal out the external environment or seal-in to prevent leakage. What makes EMI gaskets different is that they also seal against conducted or radiated EMI that can interfere with circuits. When this electromagnetic interference “noise” reaches the EMI gasket, the signals are negated and the resulting electrical current is sent to ground. Silicone is normally an electrical insulator rather than an electrical conductor, but the addition of metal or metal-coated particles imparts the necessary electrical conductivity.
