The global Electromagnetic Vibratory Linear Feeder market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

An electromagnetic vibratory linear feeder is a device used to feed parts or materials in a controlled manner using electromagnetic vibrations. It consists of a tray or trough that is mounted on a base and driven by an electromagnetic coil. When the coil is energized, it creates a magnetic field that causes the tray to vibrate, moving the parts or materials along the tray in a linear direction. This type of feeder is commonly used in manufacturing and assembly processes to automate the feeding of components or materials to other equipment or processes.
