## Abstracts

The global Electromyographs market size is expected to reach \$ 1631 million by 2032, rising at a market growth of 6.1% CAGR during the forecast period (2026-2032). In 2025, global production of electromyography (EMG) machines reached 236,000 units, with an average selling price of US\$4,457 per unit. An EMG is a medical device used to record and analyze the bioelectrical activity of the nervous and muscular systems. It collects electrical signals generated by muscles during rest, voluntary contraction, and nerve stimulation using needle electrodes or surface electrodes. After amplification and filtering, waveforms are generated and used to assess the functional state of muscles, neuromuscular junctions, peripheral nerves, and motor neurons. It is a key tool for diagnosing neuromuscular diseases (such as peripheral neuropathy, myasthenia gravis, etc.) and locating lesions. The upstream of the industry chain mainly includes core raw materials and components, such as bioelectrodes (needle electrodes, surface electrodes), sensor chips, amplifier modules, precision electronic components, and medical software algorithm development; the midstream consists of electromyography (EMG) equipment manufacturers; and the downstream comprises end users, including hospitals (especially neurology, rehabilitation, and orthopedics departments) and specialty clinics. In addition, rehabilitation centers, sports research institutions, and the emerging home health management market are also important growth drivers. The gross profit margin for the entire system ranges from 30% to 55%. The global electromyography (EMG) market exhibits characteristics of continuous growth, significant regional differences, technology-driven iteration, and stable expansion of downstream clinical demand. Regionally, North America is the largest market globally, boasting a developed healthcare system and high diagnostic equipment penetration. The European market is experiencing steady growth, benefiting from a comprehensive neurodiagnostic and rehabilitation service system. The Asia-Pacific region (especially China, India, and Japan) is experiencing rapid growth, driven

by increased investment in healthcare infrastructure, rising demand for neuromuscular disease screening, and the adoption of portable/mobile EMG devices. While Latin America, the Middle East, and Africa currently have a smaller market base, they show potential for further growth due to the introduction of medical technologies and increasing clinical diagnostic needs. With the development of miniaturized sensors, wireless communication, cloud data analysis, and AI algorithm integration, EMGs are evolving from traditional fixed stand-alone devices to intelligent, connected, and multi-channel highly sensitive devices, enabling faster and more accurate diagnosis and monitoring. These trends are lowering the barriers to entry and driving the growth of emerging applications beyond clinical use.
