According to our (Global Info Research) latest study, the global Electron Laser Quantum Computers market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

Electron laser quantum computers (ELQCs) are a type of quantum computer that uses the coherent interaction of electrons with electromagnetic fields in a laser to manipulate and store quantum information. Unlike classical computers, which operate on bits that can be in a state of 0 or 1, quantum computers use quantum bits, or qubits, which can exist in multiple states simultaneously.

ELQCs use a process called quantum interference to manipulate qubits, which involves the controlled interaction of electrons with laser beams to generate coherent states that can be used to encode and process information. This allows ELQCs to perform certain types of computations much faster than classical computers.

One of the advantages of ELQCs is their potential scalability, as they can be built using existing semiconductor fabrication technologies. Additionally, they can operate at room temperature, which makes them more practical for use in everyday applications.
