## Abstracts

According to our (Global Info Research) latest study, the global Electron Multipliers market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

An electron multiplier is a vacuum-tube structure that multiplies incident charges. In a process called secondary emission, a single electron can, when bombarded on secondary-emissive material, induce emission of roughly 1 to 3 electrons. If an electric potential is applied between this metal plate and yet another, the emitted electrons will accelerate to the next metal plate and induce secondary emission of still more electrons. This can be repeated a number of times, resulting in a large shower of electrons all collected by a metal anode, all having been triggered by just one.

The Global Info Research report includes an overview of the development of the Electron Multipliers industry chain, the market status of Mass Spectrometry (Channel Electron Multipliers (CEM), Continuous-dynode multipliers), Process Monitoring (Channel Electron Multipliers (CEM), Continuous-dynode multipliers), and key enterprises in developed and developing market, and analysed the cutting-edge technology, patent, hot applications and market trends of Electron Multipliers.
