Abstracts

The global Electronic Components market size is expected to reach \$ 809510 million by 2032, rising at a market growth of 5.3% CAGR during the forecast period (2026-2032).

Electronic components are the basic units that make up electronic devices and circuits, and are widely used in various electronic products, including computers, communication equipment, household appliances, medical instruments, etc. They have different functions, mainly including input, output, storage, processing and conversion of electrical signals. Common electronic components include resistors, capacitors, diodes, transistors, integrated circuits, etc. These components form complex circuits through different connections and combinations to achieve specific functions.

There are many types of electronic components, which can be divided into active components and passive components according to their functions. Active components such as transistors and integrated circuits can provide functions such as amplification and switching, while passive components such as resistors and capacitors are mainly used to limit current and store electrical energy. With the advancement of science and technology, the integration of electronic components continues to increase, the size becomes smaller, and the performance is improved, which has promoted the development of portable and intelligent devices.

In modern industry, the application of electronic components has penetrated into various fields, such as automation control, consumer electronics, communication technology, energy management and medical equipment. The reliability and performance of these components directly affect the overall performance and safety of the equipment. Therefore, the design, manufacturing and testing process of electronic components is crucial, involving knowledge of multiple disciplines such as materials

science, engineering and physics.

In recent years, the global smartphone market has expanded rapidly, and the electronic components industry will still have a certain increase in the future. The growth in shipments of terminal electronic products represented by mobile phones will have a positive effect on the growth in sales of electronic components. At the same time, the upgrading of consumer electronics products, the introduction of new technologies and the application of 5G will increase the use of electronic components in a single product, further expanding the market size of electronic components.

Due to the low labor cost and the rapid development of downstream mobile phones, automobiles and other application fields, major global electronic component manufacturers have set up production plants in mainland China, driving the improvement of mainland electronic component production capacity and technology, and promoting the transfer of production capacity to the mainland.

In the future, electronic components will be more intelligent and integrated, and play an important role in sustainable development and environmental protection, helping scientific and technological progress and social development.
