According to our (Global Info Research) latest study, the global Electronic Fiberglass for Consumer Electronics market size was valued at US\$ 965 million in 2025 and is forecast to a readjusted size of US\$ 1381 million by 2032 with a CAGR of 4.8% during review period.

Electronic fiberglass for consumer electronics is a high-performance fabric made from ultrafine electronic-grade glass fiber yarn through special weaving and surface treatment. It offers insulation, heat resistance, high strength, and low dielectric loss. It is the core substrate for printed circuit boards (PCBs) in consumer electronics products such as smartphones, tablets, and wearables. Global sales of electronic fiberglass for consumer electronics reached 1.25 million tons in 2025, with an average selling price of approximately US\$750 per ton. The upstream process consists of mineral raw materials such as quartz sand and pyrophyllite, which are drawn into electronic yarn using a tank kiln. The midstream process includes weaving (plain weave on air-jet looms), fiber opening (high-pressure water jet single-fiber separation), post-processing (silane coupling agent impregnation), and micro-impurity control (ppm-level metal impurities). The downstream process forms a complete transmission chain: electronic fabric - copper-clad laminate (CCL) - PCB - consumer electronics terminal.

The main market drivers include:

Technological Iteration and High-Frequency/High-Speed ??Demand Driving Material Upgrades

Technological innovation in the consumer electronics sector directly drives the

performance iteration of electronic glass fiber. With the widespread adoption of 5G, AIoT (Artificial Intelligence of Things), and AI servers, the requirements for signal transmission speed and energy efficiency have significantly increased. For example, 5G base station millimeter-wave transmission requires low dielectric loss (Dk
