## Abstracts

The global Electronic-grade Ultra-thin Glass Fabric market size is expected to reach \$ 4131 million by 2032, rising at a market growth of 5.7% CAGR during the forecast period (2026-2032).

Electronic-grade Ultra-thin Glass Fabric is an ultra-thin electronic textile manufactured through precision processes including plain weaving, pre-desizing / thermal desizing, fiber opening, surface modification and coupling agent treatment, using electronic-grade glass fiber yarns (mostly ultra-fine single-filament yarns) as the reinforcement substrate. It is mainly used as the reinforcing and insulating base material for copper clad laminates (CCL), prepregs, printed circuit boards (PCB) and IC substrates. It usually appears as white or off-white rolled fabric with uniform plain-woven warp and weft structure. Its core performance requirements include thin and uniform thickness, sufficient fiber opening, good resin impregnation, stable dielectric properties, excellent thermal dimensional stability, high temperature resistance, humidity and heat resistance, resistance to conductive anode filament (CAF), and low apparent defects. In 2025, global sales volume of Electronic-grade Ultra-thin Glass Fabric reached approximately 175 million meters, with an average price of 15.85 USD/meter and an average industry gross margin of about 36%.

This report studies the global Electronic-grade Ultra-thin Glass Fabric production, demand, key manufacturers, and key regions.
