Abstracts

The global Electronic Grade Vinyl Carbonate market size is expected to reach \$ 453 million by 2032, rising at a market growth of 6.7% CAGR during the forecast period (2026-2032).

Electronic grade vinyl carbonate refers to a class of high-end vinyl carbonate whose purity and impurity control requirements are higher than those of ordinary industrial products. It is mainly used in the field of lithium ion battery electrolyte. The product usually has extremely low moisture content, low metal ion impurities and high chemical stability. In the battery system, it can improve the dielectric performance of the electrolyte and participate in the formation of a stable boundary facial mask, so as to improve the cycle life, safety, high and low temperature performance of the battery. It can also be used in some electronic chemicals and precision materials. It is an important basic chemical in the new energy and electronic materials industry. In 2025, global Electronic Grade Vinyl Carbonate production reached approximately 185.16 K MT, with an average global market price of around US\$ 1,511 per MT.

With the continuous growth of demand for new energy vehicle power batteries, high-end energy storage systems, and high-performance consumer electronics batteries, the market size of electronic grade vinyl carbonate continues to expand. The industry is developing towards higher purity, stricter impurity control, and stable batch supply capacity. At the same time, electrolyte companies are constantly increasing their requirements for material consistency and quality stability, promoting production enterprises to continuously upgrade in refining technology, quality control, and industrial chain integration. In the future, the overall market will maintain stable growth and gradually develop towards high-end.
