According to our (Global Info Research) latest study, the global Electronic Personal Radiation Dosimeter market size was valued at US\$ 697 million in 2024 and is forecast to a readjusted size of USD 885 million by 2031 with a CAGR of 3.5% during review period.

An Electronic Personal Radiation Dosimeter (EPD) is a device used to measure and record the radiation dose received by an individual in real-time. It is commonly used in industries where workers are exposed to ionizing radiation, such as nuclear power plants, medical facilities, and laboratories. The EPD is worn by the individual and continuously monitors the radiation levels in their surroundings. It provides immediate feedback to the wearer, alerting them if the radiation levels exceed a safe threshold. The device records the accumulated radiation dose, which can be downloaded and analyzed later for regulatory compliance and safety purposes. EPDs are essential tools for ensuring the safety of workers and complying with radiation protection regulations.

The market for Electronic Personal Radiation Dosimeters (EPDs) is experiencing steady growth due to the increasing awareness about radiation safety and the need for accurate monitoring of radiation exposure in various industries. EPDs are essential devices used to measure and record the radiation dose received by individuals in real-time. They are widely used in industries such as nuclear power plants, medical facilities, research laboratories, and industrial settings where workers are exposed to radiation.

The market is being driven by stringent regulations and guidelines regarding radiation safety, which have increased the demand for EPDs. Additionally, advancements in technology have led to the development of more compact, user-friendly, and accurate

EPDs, further fueling market growth.

With the growing emphasis on worker safety and the need for accurate radiation monitoring, the market for EPDs is expected to continue its upward trajectory in the coming years.
