According to our (Global Info Research) latest study, the global Electronic Positioning Receiver market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

An electronic positioning receiver is a device used to receive and process signals from the Global Positioning System (GPS), Global Navigation Satellite System (GNSS) or other satellite navigation systems. It is a key component in modern navigation and positioning technology. Electronic positioning receivers receive navigation signals from satellites and use internal signal processing and calculation algorithms to calculate the receiver's position, speed, time and other information. It can determine the geographical location of the receiver in real time and provide high-precision positioning data.

Electronic positioning receivers usually consist of antennas, radio frequency front-ends, digital signal processors and computing units. The antenna is used to receive satellite signals, the RF front-end is responsible for signal amplification and filtering, the digital signal processor is responsible for demodulating and decoding the received signals, and the computing unit is responsible for executing the positioning algorithm and calculating the position of the receiver. Electronic positioning receivers are widely used in aviation, navigation, transportation, agriculture, surveying, geological exploration and other fields. It can provide accurate positioning and navigation information, help users determine location, navigation path, measure distance, etc., and provide positioning and navigation support for various applications.
