The global Electronic Spirometry Machine market size is expected to reach \$ 1264.3 million by 2029, rising at a market growth of 6.1% CAGR during the forecast period (2023-2029).

Spirometry Machine is a medical device used to measure lung function. It is a type of pulmonary function test (PFT) that measures the amount and speed of air that a person can inhale and exhale. The electronic spirometer is designed to measure both the volume and flow of air in and out of the lungs, and it provides an objective measure of lung function. Electronic spirometry is commonly used to diagnose and monitor lung diseases such as asthma, chronic obstructive pulmonary disease (COPD), and cystic fibrosis. It is also used to evaluate the effects of medication and other treatments on lung function, and to assess the severity of lung disease. Electronic spirometers are preferred over traditional spirometers, as they offer greater accuracy, reproducibility, and ease of use. They are widely available in hospitals, clinics, and can be used by healthcare professionals or trained patients at home.
