Abstracts

The global Electronic Suspension-by-wire Element market size is expected to reach \$ million by 2029, rising at a market growth of % CAGR during the forecast period (2023-2029).

A typical suspension structure is composed of elastic elements, guide mechanisms, shock absorbers, etc., and individual structures also have buffer blocks, stabilizer bars, etc. Elastic elements are in the form of leaf springs, air springs, coil springs, and torsion bar springs. Modern car suspensions mostly use coil springs and torsion bar springs, and some high-end cars use air springs. The elastic element is mainly used to bear the vertical force and convert it into elastic potential energy, so as to reduce the impact caused by the car running on the uneven road.
