According to our (Global Info Research) latest study, the global Electronic Trap market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

An electronic trap is a device used to remove unwanted liquids from gas or liquid pipes. It is often used in industrial areas, especially in steam systems, to ensure the normal operation of pipes and equipment.

The main function of the trap is to remove condensate or other liquids accumulated in the pipeline to prevent pipeline blockage, corrosion and damage. An electronic trap is an automatic control device that uses sensors to detect the level of liquid within a pipe, opening and draining the liquid once the water level reaches a predetermined threshold, then closing when the water level drops. This ensures that excess water does not accumulate within the pipes, increasing the efficiency and reliability of the system.

Compared with traditional manual traps, electronic traps have a higher degree of automation and precise control, and can be adjusted as needed, reducing manual intervention in operation and maintenance. This type of trap is typically controlled by a microprocessor or PLC (programmable logic controller) and can be integrated into industrial automation systems for more advanced pipeline management and monitoring.
