## Abstracts

The global Electronic Waste Management Service market size is expected to reach \$ 7126 million by 2032, rising at a market growth of 6.4% CAGR during the forecast period (2026-2032).

Electronic Waste Management Service is a comprehensive environmental service that systematically collects, sorts, dismantles, recycles, and harmlessly disposes of waste electronic and electrical equipment. Its core processes include: equipment testing and data destruction, physical dismantling and separation (plastics, metals, glass, cables), precious metal (gold, silver, palladium) refining, safe handling of hazardous substances (lead, mercury, cadmium), and testing and sales of reusable components. This service aims to reduce heavy metal pollution of soil and water bodies by electronic waste and to recover valuable resources such as copper, aluminum, and rare earth elements, thereby reducing the need for mineral extraction. It is widely used in urban solid waste management systems and in the enterprise IT asset disposal and recycling industry. Compliant with WEEE (EU) and Basel Convention regulations, it is a crucial link in achieving the goals of a circular economy and carbon neutrality.

The global Electronic Waste Management Service market exhibits a pattern of policy leadership in Europe, large-scale operation in China, maturity in North America, and rapid growth in Southeast Asia. Europe boasts the strictest WEEE directive and a well-developed recycling system, with countries like Switzerland and Germany achieving recycling rates exceeding 80%. Companies such as Umicore and Veolia are technologically advanced. China is the world's largest processor of electronic waste, and in recent years has cracked down on illegal imports and promoted the construction of a formal recycling system, with companies like GEM and China Recycling Resources achieving large-scale processing capabilities. North America, primarily the United

States, has significant differences in state legislation, resulting in strong demand for enterprise IT asset disposal and precious metal recycling. Southeast Asia (Thailand, Malaysia, and Vietnam) has become a new hub for global electronic waste transfer, but environmental regulations are relatively weak. Future trends include urban mining development, efficient precious metal extraction technologies (bioleaching), automated dismantling robots, and carbon footprint accounting. Major obstacles include illegal dumping and smuggling, high costs of formal recycling, low consumer awareness of recycling, and the difficulty of handling hazardous materials. Dynamically, the EU is promoting repairable/recyclable design standards for electronic products, and the recycling of battery metals such as lithium and cobalt is becoming a hot topic.
