The global Electronically Controlled Dryer market size is expected to reach \$ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

An electronically controlled dryer is a device that uses electricity as energy and controls the drying process through an electronic control system. Usually used in drying processes in industrial production, such as food processing, chemical industry, pharmaceuticals, material processing and other fields. Electronically controlled dryers usually include heating systems, fans or blowers, control systems and other components. The heating system can use electric heating equipment such as resistance heaters and electric heating tubes to heat the air or other media to a certain temperature through electric energy, and then send the hot air or hot medium into the drying room or drying equipment through fans or fans to complete the drying of the materials. process. The control system can accurately control drying temperature, humidity, time and other parameters as needed to achieve automated management of the drying process. Electronically controlled dryers have the advantages of high temperature control accuracy, easy operation, and controllable energy consumption. They are suitable for industrial production scenarios that have high requirements on the drying process. At the same time, since electricity serves as an energy source, electronically controlled dryers can also be more easily integrated with other automation equipment and systems to realize automated control of production lines.
