## Abstracts

According to our (Global Info Research) latest study, the global Electronics Ceramics market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

Electronic ceramics is a complex area for materials. They are usually a small part of a product that is not considered to be ceramic, usually involving several companies. One company makes the electronic ceramic starting with raw materials such as oxides. A second fabricates it into a ceramic component, e.g., a capacitor or ceramic substrate, while a third integrates it onto an electronic subassembly such as a printed circuit board (PCB). Finally a fourth company inserts the subassembly in the final electronic product, e.g., a television or personal computer—the item an end user recognizes. The fourth company may not even be familiar with the composition of the ceramic, knowing it merely as a sensor, capacitor, or disk drive head. In general, the latter two groups of companies see themselves as electronics companies, while the first two do not. Each company tends to work on environmental issues they control, unable to know/influence what the other companies do. Note there are companies, such as those making sonar for underwater applications, that go from raw materials to the completed transducer encased in metal/plastic and protected by rubber. These are in the minority among electronic ceramics users.

The most economically important types of electronic ceramics include substrates, integrated circuit (IC) packages and multichip modules, capacitors, ferrites, insulators, piezoelectrics, and superconductors.
