Abstracts

According to our (Global Info Research) latest study, the global Electroplating Grade PC/ABS Alloy market size was valued at US\$ 2002 million in 2024 and is forecast to a readjusted size of USD 2734 million by 2031 with a CAGR of 4.4% during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Electroplating grade PC/ABS alloy requires good adhesion between the metal coating and the substrate. Electroplating grade PC/ABS alloy is an alloy made by blending polycarbonate (PC) and acrylonitrile-butadiene-styrene copolymer (ABS). PC is a very common substrate in engineering plastics. Its advantages are high mechanical strength and strong impact resistance, but poor fluidity and easy cracking. As one of the general plastics, ABS has good electroplating performance and strong corrosion resistance, but low impact resistance. Therefore, the composite of PC and ABS provides a new direction for the modification of engineering plastics. The mixed PC/ABS material not only has the good impact resistance and formability of ABS material, but also has excellent impact resistance and heat resistance of PC, and is widely used in automotive accessories, electronics and other products. The reason why PC/ABS can be electroplated is that the rubber component (B) is etched by chromic acid/concentrated sulfuric acid, which makes the surface of the material present microscopic roughness, increases the contact area between the coating and the plastic substrate, and thus forms a large number of holes, which play an anchoring role, so as to facilitate the subsequent sensitization activation and chemical nickel or copper plating. Therefore, generally speaking, the rubber content in electroplating grade PC/ABS will be

significantly higher than that in ordinary grade PC/ABS.
