Abstracts

The global Electroretinography market size is expected to reach \$ 84.67 million by 2032, rising at a market growth of 6.5% CAGR during the forecast period (2026-2032).

Electroretinography (ERG) is a diagnostic technique used to assess retinal function by measuring the electrical responses generated by the eye in response to light stimuli. The process involves placing electrodes on or around the surface of the eye to record the electrical activity of retinal neurons, particularly the response of retinal photoreceptors to light. This technique helps doctors detect retinal health conditions, identify early-stage diseases, and diagnose various retinal disorders such as retinitis pigmentosa, diabetic retinopathy, macular degeneration, and acute retinal conditions.

With the global increase in aging populations and the rising prevalence of chronic diseases like diabetes and hereditary retinal disorders, the demand for electroretinography devices has been steadily growing. In developed countries, the elderly population is becoming more concerned with maintaining their vision as the incidence of age-related retinal diseases rises, fueling the market's rapid growth. As an accurate diagnostic tool, ERG devices provide ophthalmologists with valuable insights into retinal functionality and enable early detection of potential retinal diseases, facilitating timely intervention and treatment.

Furthermore, advancements in medical technology have led to the development of digital and automated ERG systems, gradually replacing traditional analog equipment. These modern devices offer higher diagnostic accuracy, ease of use, and greater patient comfort, thus enhancing the efficiency of healthcare providers. As the cost of these devices continues to decrease, smaller hospitals and ophthalmic clinics are now able to afford these advanced diagnostic tools, further increasing the adoption of ERG

devices.

The market for electroretinography devices is experiencing rapid growth. In developed regions, especially with the aging population and the rise of chronic diseases like diabetes, the demand for retinal electrodiagnostic devices has steadily increased. In North America, Europe, and the Asia-Pacific region, ERG devices have seen widespread adoption, particularly in the diagnosis and management of retinal diseases such as diabetic retinopathy, retinitis pigmentosa, and macular degeneration.

In recent years, there has been a significant shift in ERG technology from traditional analog systems to digital and automated devices. These newer devices not only offer higher diagnostic precision but also improve ease of use, patient comfort, and testing efficiency. Traditional analog instruments are being gradually replaced by the next generation of digital systems that provide more accurate results, reduce patient discomfort, and enhance the efficiency of healthcare providers.

As the cost of these devices continues to decrease, more small and medium-sized healthcare institutions are able to afford retinal electrodiagnostic equipment, contributing to the wider adoption of this technology. In developing countries such as China and India, as medical standards improve and awareness of retinal diseases rises, the market demand for ERG devices is also experiencing rapid growth.
