## Abstracts

According to our (Global Info Research) latest study, the global Electrospun Mat market size was valued at US\$ 2138 million in 2025 and is forecast to a readjusted size of US\$ 5651 million by 2032 with a CAGR of 14.8% during review period.

Electrospun Mat is a nonwoven fibrous sheet produced by electrospinning, a process in which a high-voltage electric field draws polymer solutions or melts into continuous ultrafine fibers (typically tens of nanometers to a few micrometers in diameter) that are randomly or directionally deposited to form a porous mat with high surface area, tunable pore size, and controlled thickness; these mats are valued for filtration efficiency, breathability, mechanical reinforcement, and functionalization capability. The supply chain begins upstream with raw materials such as synthetic polymers (e.g., PVDF, PAN, PU, PCL, nylon), biopolymers (e.g., PLA, gelatin, chitosan), solvents, and functional additives (antimicrobial agents, catalysts, conductive fillers), followed by midstream activities including solution preparation, electrospinning equipment manufacturing, mat fabrication (lab-scale, pilot, or industrial roll-to-roll systems), post-processing (thermal bonding, cross-linking, surface coating, cutting, and lamination), and quality control, and ends downstream with integration into end-use products across air and liquid filtration, battery separators, medical wound dressings and scaffolds, protective apparel, sensors, and energy devices, which are then distributed through OEMs, system integrators, and specialty materials suppliers to industrial, medical, and consumer markets. In 2025, global electrospun mat production reaches approximately 48 million m<sup>2</sup> against an installed capacity of about 68 million m<sup>2</sup> per year, with average pricing in the range of USD 32–70 per m<sup>2</sup>, while leading manufacturers achieve gross margins of roughly 42%.
