Electrostatic Decay Tester is a specialized instrument used to measure the rate of electrostatic charge decay on the surface of materials such as textiles, medical protective clothing, non-woven fabrics, and plastic films. It applies a high voltage to charge the sample and measures the time required for the charge to decay from its peak value back to its initial value, thereby evaluating the material's antistatic properties. This instrument is widely used in textiles, medical devices, electronics, and other fields to ensure the safety and stability of materials during use. In 2025, the global production of Electrostatic Decay Tester reached 16,350 units, with an average price of US\$6,580 per unit, and the gross profit margin of major companies in the industry was approximately 35%-48%.
