Abstracts

ESD (Electrostatic Discharge) shoes are safety footwear used to prevent accidents caused by electrostatic discharge.

When people walk or do other activities, they are charged by electrostatic induction caused by friction between clothing and other objects. This phenomenon means that unless some measures are taken, people are always in a dangerously charged state that can trigger ignition of flammable materials or electric shocks. To avoid this, it is simple and effective to wear ESD shoes that allow static electricity generated to escape from the soles to the floor so that it does not accumulate on the human body.

It is important to note that it is difficult to maintain the original performance of ESD shoes if the soles are worn out or coated, so a visual check before use is the first step to safety.

According to our (Global Info Research) latest study, the global Electrostatic Discharge Shoes market size was valued at US\$ million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of %during review period.
