According to our (Global Info Research) latest study, the global Electrostatic Fabric Integrated Precipitator (EFIP) market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

In this report, we will assess the current U.S. tariff framework alongside international policy adaptations, analyzing their effects on competitive market structures, regional economic dynamics, and supply chain resilience.

Electrostatic Fabric Integrated Precipitator (EFIP) is an advanced air pollution control device that integrates electrostatic precipitation and fabric filtration into a single unit. In this system, particulate-laden gas first passes through an electrostatic section, where particles are electrically charged and collected on electrode plates. The partially cleaned gas then flows through a fabric filter section, where remaining fine particles are captured on filter bags. This integrated design maximizes particle removal efficiency, reduces overall system pressure drop, and extends the life of the fabric filters by reducing dust load. The EFIP is particularly effective in industrial applications requiring high-efficiency dust removal and low emissions.
