According to our (Global Info Research) latest study, the global Electrostatic Shielding Cardboard market size was valued at US\$ million in 2025 and is forecast to a readjusted size of US\$ million by 2032 with a CAGR of %during review period.

Electrostatic shielding cardboard is a material that can effectively reduce ground interference and improve the system's anti-interference ability. In power equipment such as transformers, it is often used as key components such as windings, layered insulation and shielded windings to protect the inside of the equipment from the influence of external electrostatic fields, while preventing the electrostatic field generated inside the equipment from interfering with the outside world.

The principle of electrostatic shielding is based on the state of electrostatic equilibrium. When a conductor (here, the cardboard material is specially treated to be conductive) is in an external electric field, the free charge inside it will be redistributed until a dynamic equilibrium state is reached, that is, the internal field strength is zero everywhere. In this way, the conductor shell (or cardboard) protects the area it encloses from the influence of the external electric field.
