According to our (Global Info Research) latest study, the global Embedded Ground Rangefinder market size was valued at USD 964.7 million in 2022 and is forecast to a readjusted size of USD 1631 million by 2029 with a CAGR of 7.8% during review period. The influence of COVID-19 and the Russia-Ukraine War were considered while estimating market sizes.

A rangefinder is a radio navigation device that measures the slant distance between an aircraft and a ground transponder. It consists of an airborne interrogator and a ground answering station. A method of determining the distance between the two by measuring the time it takes for radio waves to travel back and forth from an aircraft to a radio station. In aviation, the pulse wave near 1000MHz is used to inquire and answer, and its working distance is about 500km, which is used on the air route. In addition, in order to cooperate with the microwave landing system during approach and landing, a precision rangefinder has been developed, which uses the waveform of the pulse front with a faster rising rate to improve accuracy, and its operating distance is about 40km. The working frequency of the two rangefinders is the same, so they can work compatible.
