According to our (Global Info Research) latest study, the global EMC Anechoic Chambers market size was valued at US\$ 416 million in 2024 and is forecast to a readjusted size of USD 657 million by 2031 with a CAGR of 6.6% during review period.

An EMC anechoic chamber is a specialized indoor environment that's designed specifically to accurately measure the electromagnetic emissions that are produced from electronic devices. Electromagnetic emissions are measurable waves of electromagnetic energy that are released from devices during their operation. An electromagnetic compatibility (EMC) or anechoic chamber is a highly specialized piece of test equipment used in the testing of electronic devices against regulatory standards concerning both radiated and conducted radio frequency (RF) emissions and immunity. EMC or anechoic chambers are designed to create an enclosure with an extremely high level of shielding attenuation against electromagnetic interference.

High-performance absorbers (e.g., Emerson & Cuming's ferrite tiles and hybrid materials) are critical for minimizing reflections and improving test accuracy

Environmental compliance (REACH, RoHS) is prioritized in material production, aligning with global sustainability goals.

Manufacturers emphasize tailored solutions, requiring clients to specify chamber dimensions, power needs, and ventilation during procurement.

Modular designs (e.g., Holland Shielding's ANEC series) allow scalability for diverse testing environments, from small metrology labs to large automotive facilities.

Manufacturers are focusing on eco-friendly materials for RF absorbers and improved ventilation systems to reduce energy consumption. The use of digital twin technology for chamber design optimization is emerging.

Hybrid chambers that support both EMC and RF testing (e.g., 5G, antenna, and EMI testing) are gaining popularity. This reduces infrastructure costs and enhances testing efficiency.
