Emergency rudder angle telegraph system is a communication system used on ships to transmit the desired rudder angle from the bridge to the engine room in emergency situations. It consists of a telegraph repeater on the bridge and another repeater in the engine room, connected by a dedicated cable or wireless communication. When an emergency situation occurs, the bridge personnel can transmit urgent rudder angle commands to the engine room using the telegraph repeater. This system is crucial for providing immediate control and response to steering emergencies to ensure the safety and maneuverability of the vessel.
