Abstracts

The global EMI Conductive Film market size is expected to reach \$ million by 2030, rising at a market growth of % CAGR during the forecast period (2024-2030).

EMI conductive film is a material used for electromagnetic interference shielding. It can bond conductive particles or metal mesh to a flexible or rigid substrate through conductive glue or conductive adhesive to form a film with a certain thickness and conductivity. EMI conductive film can be used for grounding and shielding of electronic equipment such as display modules, camera modules, connectors, ventilation panels, etc. to improve signal integrity and reduce electromagnetic interference. The advantage of EMI conductive film is that it can save space and cost, support late addition of design, and eliminate the need to redesign the electrical system.

This report studies the global EMI Conductive Film production, demand, key manufacturers, and key regions.
