Abstracts

The global Empty Capsules market size is expected to reach \$ 5898 million by 2032, rising at a market growth of 6.6% CAGR during the forecast period (2026-2032).

An empty capsule is a bottle-shaped or sleeve-shaped container made of film-forming materials, with specific shapes and sizes, and is specially used for filling various drugs or health supplements. Its upstream supply chain mainly consists of manufacturers of capsule materials such as high-purity pharmaceutical-grade gelatin, hydroxypropyl methylcellulose, and pullulan dextrin, as well as suppliers of antioxidants and colorants; its downstream supply chain is vertically connected to global large pharmaceutical enterprises, health supplement processing factories, and research and clinical institutions. In the manufacturing process, industry barriers mainly focus on high-precision impregnation molding technology and moisture content control technology. According to global core industrial data, the global average market price of empty capsules is \$2.3 per 10,000 capsules. In terms of sales volume and production capacity, the global annual total sales reach 980 billion capsules, the global nominal production capacity is 125 billion capsules, and the industry average gross profit margin is 28%, and the net profit margin is 11%.

The demand for the precision of dosage forms in the global pharmaceutical market is driving the empty capsule industry to rapidly transform towards vegetarianization and functionalization. In terms of future trends, non-animal-derived capsule materials are replacing traditional gelatin capsules at a rate of over 20% per year to meet the demands of vegetarianism, religious dietary restrictions, and the avoidance of animal-derived diseases worldwide; at the same time, enteric-coated capsules that can precisely control the disintegration site, colon-targeted release capsules, and special capsules developed for inhalation agents are becoming the focus of high-end research

and development. In terms of driving factors, on one hand, the increase in the global elderly population base leads to a continuous increase in the dosage of chronic disease medications, and capsule formulations, due to their easy swallowing and odor-masking characteristics, have become the preferred choice for elderly patients; on the other hand, the explosive growth of the health management market has led to the large-scale adoption of plant empty capsules with low water content as carriers for various water-sensitive natural ingredients such as plant extracts and probiotics.
