According to our (Global Info Research) latest study, the global Emulsifiers for Metalworking Fluids market size was valued at US\$ million in 2024 and is forecast to a readjusted size of USD million by 2031 with a CAGR of %during review period.

Emulsifiers for metalworking fluids are chemical additives used to create stable emulsions in metalworking fluids or cutting fluids. Metalworking fluids are used in various machining operations, such as cutting, grinding, and drilling, to improve tool life, reduce friction and heat generation, and enhance the overall machining process. These fluids can be oil-based or water-based, and emulsifiers are particularly important in water-based formulations.

There has been a growing preference for water-based metalworking fluids due to their reduced environmental impact and better worker safety compared to oil-based fluids. This shift has led to an increased demand for emulsifiers that can effectively stabilize water-oil emulsions in these formulations.
