Nowadays, emulsifiers are a common ingredient in baked products. For bread, emulsifiers are essential to the final product quality and the stability of dough during processing, while for cake and pastries, they improve gas bubble stability and helps to obtain lighter, more tender and moist products.

Tough, dry, stale, leathery, tasteless...These are words that describe baked goods without emulsifiers. The processing, distribution and storage of these products necessitates the use of food additives to maintain the quality and freshness that consumers expect. Emulsifiers, a subset of surfactants, are commonly used in many food products. An emulsion is a dispersion of small droplets of one immiscible liquid within another. Emulsifiers keep the droplets from coalescing. Although these food additives may offer some degree of emulsification, they perform more important functions in baked goods, such as starch complexing, protein strengthening and aeration.
