According to our (Global Info Research) latest study, the global End-of-Pipe Air Pollution Control Equipment market size was valued at USD million in 2023 and is forecast to a readjusted size of USD million by 2030 with a CAGR of % during review period.

End-of-pipe is a technology deployed to decrease or eliminate emission of substance into the atmosphere that can harm human health or environment. Air pollution control is one of the major areas of pollution control, along with solid waste management, wastewater treatment and hazardous waste management. Air is said to be polluted when it contains harmful substances in high concentration and causes undesirable effects. End-of-pipe air pollution control equipment helps in reducing emission of harmful gases by cleaning exhaust and polluted air before it emits from the factories or plants.

Increasing magnitude of air pollution across the globe is encouraging countries in North American and European regions to deploy end-of-point air control equipment to control the levels of air pollution, which in turn driving the growth of end-of-point air pollution control equipment market. In addition, national governments of various countries such as U.S, Germany, China and Japan are taking initiatives to reduce the impact of increasing air pollution on ecology and human health. This is further expected to fuel the growth of end-point air control equipment market over the forecast period. Other major drivers such as growing involvement of green lobby group and increasing investments by plants to implement air pollution control equipment to meet regulatory compliances is supporting the growth of this market. However, high initial cost associated with implementation of end-of-point air pollution control equipment is hindering the growth of

this market to some extent.
