According to our (Global Info Research) latest study, the global Endogenous Peptide Substances market size was valued at USD million in 2022 and is forecast to a readjusted size of USD million by 2029 with a CAGR of % during review period.

The driving force of endogenous peptides mainly comes from the following aspects:

Biological functions of bioactive peptides: Bioactive peptides have a variety of biological functions, such as neuromodulation, immune regulation, anti-inflammation, anti-tumor, etc. These functions play an important role in maintaining normal physiological functions and health of the human body. For example, endorphins have analgesic effects and can relieve pain, while growth hormone-releasing hormone can stimulate the secretion of growth hormone and regulate the growth and development of the human body. These functions enable endogenous peptides to play important physiological roles in the human body.

Demand for drug research and development: With the development of medical technology, people's demand for drugs is getting higher and higher. As an important type of biological drugs, peptide drugs are receiving more and more attention in their research and development and application. Peptide drugs have many advantages, such as high efficiency, low toxicity, and good biocompatibility. Therefore, they are widely used in anti-tumor, anti-infection, neurological diseases and other fields. As an important source of peptide drugs, endogenous peptides have received more attention in their development and utilization.

Progress in production technology: Since the chemical structure and biological activity

of endogenous peptides are strictly protected, special attention needs to be paid to maintaining their original biological activity during production and processing. With the continuous advancement of production technology, people have explored more efficient and safer preparation methods, which has greatly improved the production efficiency of endogenous peptides and reduced costs.

Expansion of indications: As the research and development of endogenous peptides continues to deepen, their indications are also expanding. For example, insulin is an important drug in the treatment of diabetes, while growth hormone is widely used in anti-aging and other fields. The expansion of these indications has led to an increasing demand for endogenous peptides.
