According to our (Global Info Research) latest study, the global Endoscopic Bariatric Therapy Devices market size was valued at US\$ 155 million in 2024 and is forecast to a readjusted size of USD 265 million by 2031 with a CAGR of 8.7% during review period.

Among the various developed Endoscopic Bariatric Therapy (EBT) devices, the intragastric balloon (IGB) is the most widely used in clinical settings. The IGB is inserted into the stomach via endoscopy, occupying space to reduce gastric volume and delay gastric emptying. This helps patients control appetite, reduce food intake, and facilitate weight loss. It is primarily indicated for individuals with a Body Mass Index (BMI) between 30 and 40 who have not achieved weight loss through diet and exercise, and it is also used as a bridge therapy before bariatric surgery. The IGB is reversible and typically removed endoscopically after six months. In recent years, advancements in technology have led to the development of next-generation EBT devices, such as adjustable balloons, biodegradable balloons, and endoscopic suturing techniques, providing safer, minimally invasive, and more personalized treatment options for obese patients.
